

## IBM i Software Change Management

Assured end-to-end management of software development processes for the IBM i and beyond

TURNOVER® is an IBM i-centric software change management solution with fully integrated issue tracking, project management, PC/Java version control, and application deployment functionality

**Designed for companies that want to leverage the strengths of the IBM i platform even as they expand into Java, web and PC technologies, TURNOVER® provides a framework of assured control around the repeatable procedures that you define for developing, deploying, and maintaining your enterprise software. Through the adoption of TURNOVER®, the following benefits can be realized:**

- Greater stability and reliability of applications through comprehensive end-to-end management of the software development lifecycle
- Reinforced control of best-practice development processes and procedures, as defined by you, to underpin the ongoing development and cross-platform deployment of your enterprise applications
- Enhanced management of processes across diverse or geographically dispersed development teams working in complex environments
- Increased levels of agility, collaboration and visibility of software development projects that take place within the organization
- Comprehensive IT accountability and audit compliance; as required for the Sarbanes-Oxley Act (SOX), HIPAA and other regulations
- Built-in interfaces for popular industry-standard tools and applications
- Optimized productivity using native, Eclipse and web user interfaces

### The software change management solution

Whether you manage an IT department or design and develop software, TURNOVER® can help you do your job more efficiently and accurately.

TURNOVER® ensures that you can quickly modify and modernize your applications, keeping them highly functional, reliable and auditable, while also providing end users a stable computing environment in which to conduct daily business.

TURNOVER® supports the repeatable procedures that you define for developing, deploying, and maintaining software across all technology teams. It provides a secure, stable and reliable framework through which the quality of software developments can be increased, efficiency gains realized and business risk reduced.

TURNOVER® can offer fully integrated issue tracking, IBM i software change management, PC/Java version control, project management, and application deployment capabilities.

Enables cross-department and cross-team collaboration with role-based interfaces that facilitate information sharing among contributors

Provides regulatory auditing compliancy

Optimizes developer productivity

## End-to-end management of the software development lifecycle

TURNOVER® provides the power to manage the full software development lifecycle - from issue tracking, to project management, analysis, development, testing/QA and deployment - for all your vital software assets.

Throughout the entire development lifecycle, TURNOVER® reinforces the workflow you create; it improves efficiency and communication across all IT teams, including native IBM i, client/server and web application developers.

## Manage complex environments

TURNOVER® unifies your software management processes across diverse or geographically dispersed development teams working in complex environments. It reliably handles multiple versions of any number of applications, including those that integrate rapidly evolving e-business, client/server and traditional IBM i technologies.

TURNOVER® can also manage the modification and deployment of ISV software applications - running at multiple release levels throughout the organization - without distorting future version upgrade paths and dependencies.

TURNOVER® supports unlimited development, QA and production environments. Furthermore, it offers flexibility that makes it the natural choice for the most demanding development requirements.

## Improve process control

A common challenge that organizations face in today's IT environment is to increase productivity, with fewer people doing more.

TURNOVER® helps you define and reinforce development procedures that are based on best practices: this streamlines workflow, standardizes approval processes, improves communications and helps new hires become proficient faster.

## Optimize productivity

TURNOVER® helps developers work more efficiently. One IT department with just four developers estimates that TURNOVER®'s source and object management alone saves them \$25,000 annually - add in automated communications and change history to reduce research time, promotion processing and job scheduling to control after-hours work, and all of TURNOVER®'s other productivity enhancers, and you will see a dramatic reduction in time spent on non-programming tasks.

## Simplify audits

The Sarbanes-Oxley Act (SOX), HIPAA, and other regulations have raised the bar for IT accountability at many companies. TURNOVER® facilitates the auditing process by reinforcing your company's development policies throughout the entire development lifecycle. It documents all changes and stores all relevant information in a single location, so auditors can easily verify the history of any given change from inception to deployment.

## Implement modernization strategies

TURNOVER® protects your technology investment by supporting practically any application modernization strategy that you can imagine, with specialist expertise in strategies recommended by the IBM i roadmap.

## Familiar, efficient interfaces

TURNOVER® offers its comprehensive software change management functionality via native, Eclipse and mobile-first web user interfaces, all of which are intuitive and easy to use.
